

Abbe Crawford

Neurology: Year-in-Review | Abbe Crawford

This session will discuss and summarise key papers in veterinary neurology published in the previous year. We will focus on topics that have seen particular emphasis or controversy over the last 12 months, as well as those relating to conditions encountered in emergency and critical care. We will consider the main take home messages from each publication, how these can be applied to clinical practice and what questions remain to be addressed.

Tools to evaluate neurological function in the ICU patient: EEG and beyond | Abbe Crawford

In human neurocritical care a range of diagnostic tools are used to support clinical assessments, guide management decisions and optimise prognostication. These tools include advanced imaging, electroencephalography and serum biomarkers. In this session we will discuss the potential utility of such tools in veterinary medicine, with a particular focus on electroencephalography and other electrodiagnostic tests of brain function.
